5.	Expected Output	16

1. SCENARIO / PROBLEM STATEMENT

1.1 Scenario

LearnHub is an online course portal that offers technology courses such as Full Stack Web Development, Data Science with Python, Artificial Intelligence, Cyber Security and Cloud Computing to students across the country. Every learner must first create an account before enrolling in a course. At present the portal collects data through plain text boxes, so students often enter wrong email addresses, invalid phone numbers, impossible birth dates and weak passwords. This produces bad records, failed confirmation mails and many support requests.

1.2 Problem Statement

An online course portal needs a Student Registration Form. Select suitable HTML5 input types for email, phone number, date of birth, password and the other fields, so that the browser itself helps the student to enter correct data (proper keyboards on mobile devices, date picker, masked password, built-in validation) and the portal receives clean and complete data.

1.3 Requirements

- **Correct input types:** each field must use the HTML5 input type that best matches its data (email, tel, date, password, url, number, range, time, month, file, radio, checkbox, select and textarea).
- **Validation:** use HTML5 attributes (required, pattern, min, max, minlength, maxlength) together with a small JavaScript layer for friendly messages.
- **Security:** the password must be hidden, at least 8 characters long, and contain upper-case, lower-case and numeric characters; a confirm-password field must match it.
- **Usability:** labels, placeholders, hints, a password-strength meter, grouped sections and a responsive layout for phones and desktops.
- **Feedback:** invalid fields are highlighted in red with a message, valid fields in green, and a success message is shown after a correct submission.

1.4 Expected outcome

- A responsive registration page in which every field uses the most suitable HTML5 input type.
- Wrong emails, phone numbers, birth dates and weak passwords are rejected before submission.
- Clear red / green feedback and a success message improve the experience of the student.
- Clean data reaches the portal, which reduces failed confirmation mails and support requests.

2. ICT TOOL USED

The following Information and Communication Technology tools were used to design, code, test and document the Student Registration Form.

S. No.	Tool / Technology	Purpose in this activity
1	HTML5	Structure of the form; semantic elements (form, fieldset, legend, label) and modern input types such as email, tel, date, password, url, number, range, time and month.
2	CSS3	Styling, grid layout, colours for valid / invalid states, and media queries for a responsive mobile view.
3	JavaScript (ES6)	Constraint Validation API, custom error messages, password-match check, strength meter and success message.
4	Visual Studio Code	Code editor used to write and format the source code (registration.html).
5	Google Chrome / Chromium	Web browser used to run the page and to inspect the behaviour of each input type.
6	Playwright (headless Chromium)	Used to open the page automatically, fill the fields and capture the output screenshots shown in this report.
7	Microsoft Word	Preparation of this Active Learning Methodology report.

2.2 System requirements

Item	Minimum requirement
Operating system	Windows 10 / Linux / macOS
Processor and memory	Dual-core processor, 4 GB RAM
Web browser	Google Chrome, Microsoft Edge, Mozilla Firefox or Safari (latest version)
Editor	Visual Studio Code or any text editor
Internet	Not required - the page is a single self-contained HTML file

3. ACTIVITY PROCEDURE

3.1 Steps followed

Step 1: Analyse: Read the problem statement and list all the data that a student must give while registering.

Step 2: Select input types: Choose the most suitable HTML5 input type for every data item (see Table 3.4).

Step 3: Create the page: Create registration.html with the HTML5 boilerplate and the viewport meta tag for mobile devices.

Step 4: Design the form: Build a form with three fieldsets - Personal Details, Account Security and Course Preferences - and add a label for every control.

Step 5: Add validation attributes: Add required, minlength, maxlength, min, max and pattern attributes so that the browser validates the data.

Step 6: Apply CSS: Style the page with CSS (two-column grid, red / green states, responsive media query).

Step 7: Add JavaScript: Write JavaScript to show messages, compare the two passwords, show the password strength and display a success message.

Step 8: Test and record output: Open the page in the browser, test empty submission, wrong values and correct values, and capture the screenshots.

3.2 Layout plan of the form

Fieldset	Fields it contains	No. of fields
Personal Details	Full name, date of birth, email address, phone number, gender	5
Account Security	Password, confirm password (with strength meter)	2
Course Preferences	Course, qualification, start month, class time, experience, study hours, profile link, photo, address	9
Agreements and buttons	Course-update checkbox, terms checkbox, Register Now and Reset buttons	4

3.3 Design decisions

- **Labels:** every control has a label linked with the for attribute, which improves accessibility and makes the click area larger.
- **Grouping:** fieldset and legend group related fields so that the long form is easy to read.
- **Hints:** short hint text under the date, phone and password fields tells the student the expected format before the mistake is made.
- **Two columns:** a CSS grid places two fields in a row on wide screens and one field per row on phones.

3.4 Selection of HTML5 input types

Data	Input type	Key attributes	Reason for selection
Full name	type="text"	required, minlength, pattern	Free text; pattern allows only letters, space and dot.
Email	type="email"	required	Browser checks the name@domain format; mobile shows the @ keyboard.
Phone number	type="tel"	pattern="[6-9][0-9]{9}", maxlength	Numeric keypad on phones; pattern enforces a 10-digit mobile number.
Date of birth	type="date"	required, min, max (today)	Built-in date picker; max blocks future dates.
Password	type="password"	minlength=8, pattern	Characters are masked; pattern demands upper, lower and digit.
Confirm password	type="password"	required	Must match the password (checked in JavaScript).
Gender	type="radio"	required, same name	Only one option can be chosen.
Course	input + datalist	list, required	Type-ahead suggestions of available courses.
Qualification	<select>	required	Fixed list of choices.
Start month	type="month"	-	Month and year picker.
Class time	type="time"	value="18:00"	Time picker.
Experience	type="number"	min=0, max=40, step=1	Numeric spinner with limits.
Study hours	type="range"	min=1, max=40	Slider for an approximate value.
Profile link	type="url"	-	Browser checks for a valid URL.
Photo	type="file"	accept="image/png, image/jpeg"	Restricts the upload to image files.
Address	<textarea>	rows, maxlength	Multi-line text.
Terms / Updates	type="checkbox"	required (terms)	Yes / no choice; terms must be accepted.

4. STUDENT ACTIVITY / IMPLEMENTATION

The complete source code of the Student Registration Form is given below. The HTML part defines the form and the input types, the CSS part gives the design, and the JavaScript part performs validation and displays the feedback. The file is saved as registration.html and can be opened in any modern web browser.

Program: registration.html

    });
</script>
</body>
</html>

```

Explanation of the code

- **Form and fieldsets:** the form uses novalidate so that our JavaScript can show custom messages, while the HTML5 constraint attributes still define the rules.
- **Email and phone:** type="email" validates the address format; type="tel" with pattern="[6-9][0-9]{9}" accepts only 10-digit mobile numbers.
- **Date of birth:** type="date" gives a calendar picker; JavaScript sets max to today and rejects students younger than 16 years.
- **Password:** type="password" hides the text; the lookahead pattern (?.*[a-z])(?.*[A-Z])(?.*[0-9]).{8,} enforces the strength rules and the meter shows the score.
- **Validation flow:** validateField() uses checkValidity() and setCustomValidity() to decide whether a field is valid and then shows the message and the red / green border.

Explanation of the CSS and JavaScript

- **CSS grid:** the .grid class creates two equal columns; the media query (max-width: 640px) changes it to one column so the form fits phone screens.
- **Visual feedback:** the .invalid class gives a red border and pink background, and the .valid class gives a green border, so the student sees the result of every field immediately.
- **Password meter:** the input event on the password field scores length, mixed case, digits and symbols and changes the width and colour of the bar.
- **Submit handler:** preventDefault() stops the page reload, every required field is validated, and the success banner is shown only when all fields are valid.

Advantages of using suitable HTML5 input types

- Mobile devices open the correct keyboard automatically (email keyboard for email, numeric keypad for phone).
- Date, month and time pickers avoid typing mistakes and wrong formats.
- Built-in validation reduces the JavaScript code and the load on the server.
- Passwords are masked, and pattern rules enforce a strong password.
- Clean and correct data is stored, so confirmation mails and phone contacts do not fail.

Behaviour of the main input types in the browser

Input type	On a desktop browser	On a mobile browser
type="email"	Rejects values without @ and a domain	Shows a keyboard with @ and .com keys
type="tel"	Accepts text; pattern checks 10 digits	Shows the numeric dial pad
type="date"	Calendar drop-down picker	Native date wheel / calendar
type="password"	Characters shown as dots	Characters masked; no auto-capitalisation
type="number"	Up / down spinner within min and max	Numeric keyboard
type="url"	Rejects values without a scheme	Keyboard with / and .com keys
type="range"	Draggable slider	Touch slider

Conclusion

Choosing the right HTML5 input type is the first and simplest level of validation. With type="email", type="tel", type="date" and type="password", the browser itself gives the student the correct keyboard, picker or masking and checks the format before the data reaches the server. Combined with attributes such as required, pattern, min and max, and a little JavaScript for friendly messages, the LearnHub registration form collects accurate data with less effort for both the student and the portal.

HTML5 validation attributes used in the form

Attribute	Purpose	Used on
required	Field cannot be left empty	Name, date of birth, email, phone, password, course, terms
minlength / maxlength	Limits the number of characters	Name, password, phone, address
pattern	Regular expression the value must match	Name, phone, password
min / max	Lowest and highest allowed value or date	Date of birth, experience, study hours
step	Step size of a number input	Years of experience
accept	Allowed file types	Profile photo (PNG, JPEG)
list (datalist)	Type-ahead suggestions	Course
placeholder / autocomplete	Sample text and browser auto-fill hints	Name, email, phone, passwords

Sample test data used for the outputs

Field	Valid data entered (Output 4 and 5)	Invalid data entered (Output 3)
Full name	Aishwarya U	Ajay Iyanraj (valid)
Date of birth	14-08-2005	10-05-2012 (under 16)
Email	aishwarya.u@example.com	ajay.iyanraj@
Phone	9876543210	12345
Password	Learn@2026	abc123
Confirm password	Learn@2026	abc124 (mismatch)
Course	Full Stack Web Development	(not selected)
Qualification	Undergraduate	(not selected)
Profile link	https://www.linkedin.com/in/aishwarya-u	linkedin.com/in/ajay
Terms and Conditions	Accepted	Not accepted

Learning outcomes

- Identified the HTML5 input type that best fits each kind of data in a registration form.
- Applied constraint-validation attributes (required, pattern, min, max, minlength, maxlength).
- Used JavaScript and CSS to give instant visual feedback and a responsive design.

5. EXPECTED OUTPUT

The screenshots below were captured from the running registration.html page in a Chromium browser. They show the form in its different states.

Output 1: Blank Student Registration Form

LearnHub Online Course Portal

Student Registration Form

Personal Details

Full Name *

e.g. Aishwarya U

Date of Birth *

mm/dd/yyyy

You must be at least 16 years old.

Email Address *

name@example.com

Phone Number *

9876543210

10-digit Indian mobile number.

Gender *

☐ Male ☐ Female ☐ Other

Account Security

Password *

Min 8 characters with upper-case, lower-case and a digit.

Confirm Password *

Fig. 5 - After a valid submission a green confirmation message with the student name and email is displayed.

Output 6: Responsive view on a mobile screen (390 px width)

Fig. 6 - On a phone the two-column layout collapses into a single column (shown in three parts, top to bottom, left to right).

Test cases

S. No.	Test input	Expected behaviour	Result
1	Submit the form with all fields empty	Every required field turns red with a message	Pass
2	Email = ajay.ianraj@	Message: valid email address required	Pass
3	Phone = 12345	Message: 10-digit mobile number starting with 6-9	Pass
4	Date of birth = 10-05-2012	Message: must be at least 16 years old	Pass
5	Password = abc123	Weak strength bar; pattern message shown	Pass
6	Confirm password different from password	Message: passwords do not match	Pass
7	Profile link = linkedin.com/in/ajay	Message: URL must start with http:// or https://	Pass
8	All fields valid and terms accepted	Green borders and success message	Pass

Result

The Student Registration Form for the online course portal was designed with suitable HTML5 input types - email for the email address, tel for the phone number, date for the date of birth and password for the password - together with number, range, time, month, url, file, radio, checkbox, select and textarea for the remaining data. The built-in validation attributes and the JavaScript feedback prevented invalid data and produced a clean, user-friendly and mobile-responsive registration page.
