

EX.NO.7a	ELECTRICITY BILL CALCULATION
DATE: 24.08.26	

AIM:

To write a JavaScript (Node.js) program that reads the units consumed and calculates the electricity bill using slab-wise tariff rates.

ALGORITHM:

1. Start the program and read the number of units consumed from the user.
2. Charge Rs. 2 per unit for the first 100 units.
3. Charge Rs. 3 per unit for the next 100 units (101 to 200).
4. Charge Rs. 5 per unit for every unit above 200.
5. Add the slab amounts to get the total bill.
6. Display the units consumed and the total bill amount.

CODE:**exp7a.js:**

```
const readline = require("readline");
const rl = readline.createInterface({ input: process.stdin, output: process.stdout });
const ask = (q) => new Promise((res) => rl.question(q, res));

(async () => {
  const units = Number(await ask("Enter units consumed: "));
  let bill = 0;
  if (units <= 100) {
    bill = units * 2;
  } else if (units <= 200) {
    bill = 100 * 2 + (units - 100) * 3;
  } else {
    bill = 100 * 2 + 100 * 3 + (units - 200) * 5;
  }
  console.log("Units Consumed : " + units);
  console.log("Total Bill      : Rs. " + bill);
  rl.close();
})();
```

OUTPUT:**Output**

```
D:\WT_LAB\Programs\Exp7>node exp7a.js
Enter units consumed: 260
Units Consumed : 260
Total Bill      : Rs. 800
```

RESULT:

Thus, the electricity bill was calculated from the units consumed using slab-wise rates in JavaScript.
